

Software Engineering and Project Management

Lecture 03 – Models, prototypes and mockups

During the third lecture of the course, we need to take a small *detour* from our journey to understand the requirements engineering process. Our goal in this lecture, therefore, will be to describe a **modeling** language, UML, that will allow us to better describe system requirements in a more precise manner.

Proposed Specific Learning Objectives: after the lecture, you should be able to

- Define the concept of model.
- Define the concept of prototype.
- Define the concept of mockup.
- Identify the differences between model, prototype and mockup. Describe how the three can be used during the software engineering activities.
- Define the concept of UML.
- Describe how the use case diagram and the sequence diagram can be used to write system requirements.
- Identify other types of UML diagram and its notation.
